# What is the project about?

-  The objective of this project was to create an interactive dashboard in Power BI to evaluate the sales of Amazon products in Argentina during 2018 and 2019. The database has one fact table and 5 dimension tables.

-  *To complete this project, I will use tools such as Power Query for cleaning and transformation and Power BI and to be able to represent it visually.*

# Process

*Throughout the transformation and cleaning, all null results have been filtered and the ids have been analyzed for duplicates. Then the tables have been transformed, eliminating unnecessary columns and modifying the existing ones. All the data was passed to its corresponding data type and the tables were related using the star format. A calendar table was also created to make it easier to work with dates and to be able to use them in kpi cards in the visualization. A DAX table was also created with the corresponding calculations.*
